# Writing a batch program executing in victim machine

Batch Scripts are stored in simple text files containing lines with commands that get executed in sequence, one after the other. Scripting is a way by which one can alleviate this necessity by automating these command sequences in order to make one's life at the shell easier and more productive.

1.Open start on the victim machine and click on command prompt and change the directory to 'Desktop'.

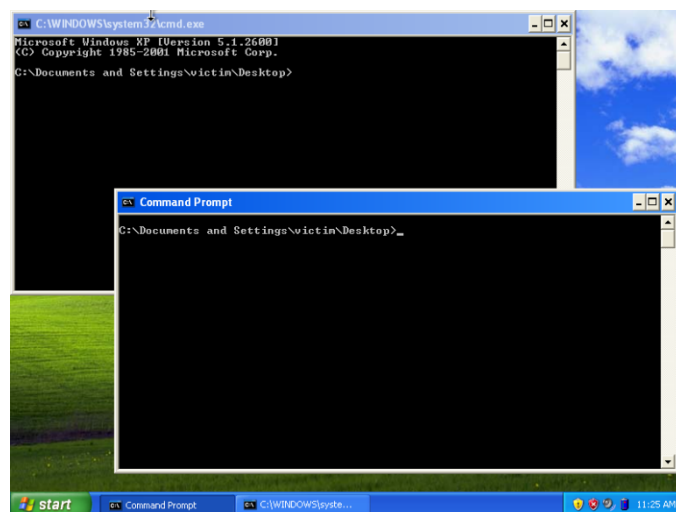

2.Writing a small batch program on the notepad.

3.Saving the batch file with a .bat extension on the desktop.

4.Clicking on the "Run CMD" file to run the script.

5.The batch program works without opening a command prompt window.

In conclusion, I have written a small batch program and executed in on the victim's machine without opening the command prompt window.
